WebApp Concept

WebApp will function to receive emails and send responses to clients. Feature of the webapp is a user friendly interface that allows the user to adjust the email quoter to their own business.

Steps	Front End	Backend
1.	User is able to login	Create an N8N Prototype - Dropped files into Database to Interactive UI (User is able to change variables)
2.	User is able to drag and drop files	Quoting database will be then created and sent to a Ai Agent
3.	User is able to see and interact with a transformed data set	AI Agent will receive incoming emails and send it through a filter.
4.	User is able to use the UI to adjusted price settings, add or remove variables.	AI agent will receive from filter A, all necessary is found, quote email will generate.
5.		Ai Agent will receive from filter B, Some information is missing, email will generate asking for missing information.
